

AF detection & direct-to-consumer wearable study seeking GP & Cardiologists to participate

Does your work involve detection, diagnosis or management of atrial fibrillation (AF)?

Researchers from the University of Wollongong want to talk to you about AF screening practices, and direct-to-consumer technologies (e.g. Apple Watch ECG) used for AF detection. We are especially interested in implications for under- or over-diagnosis of AF. This study is not funded by Apple or any other commercial interest.

This is a relatively small study, and we are looking for around 20 participants like yourself. Participation involves a **45 minute interview** by phone or in person. You will be offered a **\$150 shopping voucher** for your time.

If you are interested, or have any further questions, please contact:
