Plastic Molds Care Sheet

Tips and tricks to care for your molds

Before using the molds

- Mold release is not required for any of my molds
- Always make sure that molds are even before pouring resin or any other material into them. This is very important as otherwise the result would not have a flat even back. You will also not make use of the mold well and as a result it may be very difficult to get your pieces out. To ensure that the molds are even you can use a bowl of rice and place the mold on the rice before you start using the mold.

Getting your pieces out of the mold

- Always make sure that you fill the mold to the top. This will make it easier to get your pieces out. If you fill the mold part way, pieces will be very hard to get out.
- Leave the resin or any other material you are using to fully cure / harden.
- Once your pieces are fully cured and before starting to get your pieces out, try and get as much air as you can in between your mold and your pieces. You can easily do this by gently twisting the mold, holding the mold from the corners at opposite vertical points.
- Push out your pieces by pressing from the deepest part of the mold.

Cleaning your molds

- Use soft brushes or sponges when you wash your molds. Otherwise you might scratch the inside of the mold and this will result in dull and scratches pieces.
